CAS Roles

CAS Roles

Roles are linked to the substances and allow you to find focused publications connecting the substance of interest to its specific role within the scope of the publication.

- Super roles are broad categories and comprise all related specific roles. Examples are Analytical Study, Preparation or Occurrence
- Specific roles are more precise. They relate to aspects such as the use of the substance in an analytical study as an analyte (Analyte) or the occurrence of a compound in a plant (Natural Product Occurrence)

Roles in substance results

From a search on substance(s), the roles filter will indicate the type of roles that are connected to the substance(s) in the publications.

Reference Role

By Count | **Alphanumeric**

Example of 'reference roles' appearing in a substance answer set

Substance(s) in the answer set with that role.

- Analytical matrix (1)
- Analytical Reagent Use (1)
- Analytical Role, Unclassified (1)
- Formation, Unclassified (1)
- Geological or Astronomical Occurrence (1)

Roles in reference results

Roles will appear as a filter in reference result sets whenever you have retrieved hits in the substance indexing segment of the records, i.e. by retrieving substance names or performing a crossover after structure-based searches.

Example: I am interested in the subject of (marine) pollution, how can I find publications where polypropylene is specifically described as a pollutant?

The search for polypropylene retrieves a large number of references. The substance role window shows all roles that apply to Polypropylene in this answer set. The **Pollutant** role indicates there are 1648 publications that describe polypropylene as a pollutant.

Biosequence searching

Development

Sequence searching is developed in stages. June 2021 status:

- BLAST: Search similar sequences **Implemented**
- CDR: Search antibodies via antigen binding sites **Implemented**
- Motif: Search conserved shorter sequence patterns **Implemented**
- Global crossover from sequences to patents **Implemented**

- Crossover from sequences to scientific literature In development

BLAST similarity search

BLAST allows to search for similar nucleotide and amino acid sequences. Alignment results are shown in an intuitive graphical layout with easy-to-use precision filtering for identity and coverage percentages. Reference results are linked to the sequence hits.

Perform a BLAST search

- Open the Biosequences module from the main SciFinderⁿ search page
- Load sequence from file or paste sequence
- Supported formats: Sequences containing residues represented by single-letter codes, e.g. in the FASTA format. Leading numbers are not allowed.
- Sequence input may contain header line (starting with >). Sequences can be separated by (multiple) headers, thus allowing for batch processing
- Adjust BLAST parameters as desired and start biosequence search

The screenshot displays the Biosequences search interface. On the left, a sidebar titled 'Searching for...' lists categories: All, Substances, Reactions, References, Suppliers, and Biosequences (selected). The main area is titled 'Biosequences' and contains a search form. The form includes a text input field with the sequence 'Human Insulin Sequence' and the FASTA header 'FVNQHLGSHLVEALYLVCGERGFFYTPKTKGIVEQCCTSIICSLYQLENYCN'. There are buttons for 'Upload Sequence' and 'Clear Search'. A callout box points to the 'Upload Sequence' button, stating 'Upload FASTA sequence from file w/o preceding numbers or paste into the BLAST pane'. Another callout box points to the text input field, stating 'Paste sequence into this window'. To the right of the form, there are options for 'Sequence Type' (Nucleotide, Protein), 'Search Within' (Nucleotides, Proteins), and 'Limit Total Sequence Results to:' (20000). A 'Start Biosequence Search' button is at the bottom right. Below the search form, there is an 'Advanced Biosequence Search' section with various parameters: Sequence Identity % (set to -), Match with Gaps? (Yes/No), Gap Costs (Existence 11 Extension 1), Query Coverage % (set to 90), Word Size (set to 3), Scoring Matrix (BLOSUM62), BLAST Algorithm (BLASTp), E-Value (set to 10), and Exclude Low Complexity Regions (No). A callout box on the left points to this section, labeled 'Advanced BLAST parameters'.

Reaction searching

Reaction searches

Reactions queries can be substance names, CAS Registry Numbers, document identifiers, or a chemical structure

- Reactions are grouped into schemes with identical reactants and products
- Reactions are sorted by yield within a scheme
- Find reactions by substance name, registry number, document identifier or chemical structure

Products Ethyl (1R,3S)-3-[(benzyloxycarbonyl)amino]cyclohexanecarboxylate, Yield: 85%

Reactants 1,3-Cyclohexanedicarboxylic acid, 1-ethyl ester, (1R,3S)-
Benzyl alcohol

Reagents Triethylamine
Diphenylphosphoryl azide

Solvents Toluene

Procedure

1. Add diphenylphosphoryl azide (DPPA) (166 mL, 769 mmol) and triethylamine (107 mL, 769 mmol) to (1S, 3R) -3-ethoxycarbonylcyclohexanecarboxylic acid (140 g, 700 mmol) in toluene (1.4 L).
2. Reflux the mixture for 2 h under N₂.
3. Cool the reaction mixture to 60°C and add benzyl alcohol (87 mL, 839 mmol) in one portion.
4. Heat the mixture to 80°C overnight.

6. Stir the mixture and separate the layers.

Scoring Options

Scoring Options

For plans with predicted steps, you may increase or reduce the score assigned to steps and alternatives by each profile, which determines what is displayed in the plan/alternative steps.

- Each scoring profile may be set to Off (extreme left), Low, Medium, or High (extreme right)
- The default setting for each profile is "Medium," as shown below
- Moving the slider all the way to the left turns that profile's scoring "Off," and it will not be a factor step selection or alternative ranking

Overview Steps Scoring

Scoring Profiles

Complexity Reduction

Convergence Medium

Evidence

Yield

Atom Efficiency

Apply Reset Scoring

Complexity Reduction
Reduces the complexity of a step's reactants compared to its product.
In retrosynthesis plans, you typically want high complexity reduction.

Convergence
Determines how "branched" the plan is; **you typically want the plan to be as branched as possible (high convergence)**, rather than linear.
For a given step, the more precursors there are, and the closer their relative sizes are, the more it's considered convergent.
Increasing Convergence displays steps/alternatives with more reactants.

Evidence
Ranks plan steps/alternatives based on the number of evidence examples supporting the particular reaction type.
More evidence examples for a step **means that the reaction type has more applications and is more versatile in terms of conditions and substrates**, and hence predictions made based on it are probably more reliable.
Increasing Evidence displays steps/alternatives with more supporting examples.

Yield
Applies to the yield of each step in the plan, which contributes to the yield of the target molecule.
Increasing the Yield displays a higher yield target molecule and steps/alternatives.

Atom Efficiency
Reduces reactant parts not included in a plan step's product.
Increasing Atom Efficiency displays steps/alternatives with the least amount of reactant atoms that do not map to the product.

Clicking the **Apply** button redraws the retrosynthesis plan with the revised scoring profiles; clicking **Reset Scoring** restores the "Medium" default.

Apply Reset Scoring

Markush Searching and PatentPak

Markush searching

Markush structure searches can be performed by using the Search Patent Markush option while in Substances search mode

The screenshot shows the CAS SciFinder interface in Substances search mode. On the left, there are filters for 'Markush search type' (As Drawn (96), Substructure (119)) and 'Filter by first patent authority' (World Intellectual Property Organization (55), United States (25), European Patent Organization (8), China (3), United Kingdom (2)). The main area displays 'Patent Markush (96)' results. A callout box highlights the 'Search Patent Markush' checkbox and the 'Markush search option' label. Another callout points to the 'PATENTPAK' dropdown menu, labeled 'Markush location'. A third callout points to a specific patent entry, labeled 'Link to a specific patent reference'. A fourth callout points to the 'PATENTPAK Viewer' dropdown, labeled 'Link to PatentPak Viewer'.

PatentPak

Up to three PatentPak Options for viewing a patent PDF:

- **PDF:** Full-text patent PDF only; text-searchable PDF
- **PDF+:** Full-text patent PDF with marked-up Key Substances; text-searchable PDF
- **Viewer:** Patent PDF with linked markups of Key Substances; see below:

The screenshot shows the PatentPak Viewer interface. At the top, there are controls for 'Display controls', 'Download PDF', and 'Download PDF including chemistry annotations'. The main content area displays patent text with chemical structures and annotations. A callout box points to a chemical structure, labeled 'Link to location of substance in patent'. Another callout points to a highlighted key substance, labeled 'Highlighted key substance is marked'. A third callout points to a key substance, labeled 'Marks key substance curated by CAS scientists'. A fourth callout points to a list of key substances, labeled 'Key substances identified in the patent are annotated'. The interface also shows a sidebar with 'Key Substances in Patent' and a 'Substance Detail' panel for CAS RN 33454-82-9.

Supplier Searching and ChemDoodle®

Suppliers searching

Suppliers searching allows for direct access to chemical catalog information based on chemical structure, names or other identifiers

The screenshot displays the 'Suppliers' search results page. On the left, there is a 'Filter Behavior' panel with options to 'Filter by' or 'Exclude'. Below this, filters are shown for 'Preferred Suppliers' (No Preference: 12), 'Supplier' (Hayashi Pure Chemical Products Catalog: 2, abcr GmbH Product List: 1, Glentham Life Sciences Product List: 1, Kishida Chemical Product List: 1, Oakwood Chemical Product List: 1), and 'Purity' (95-98%: 2, <90%: 1). The main area shows a list of 12 suppliers, with the first one being TCI Europe Research Chemicals (Belgium). A callout box labeled 'Preferred/non-preferred supplier tagging' points to a radio button next to the supplier name. A 'Link to detail' callout points to a link icon. The 'Supplier Detail' view for TCI Europe Research Chemicals is shown, featuring contact information (Web, Email, Phone), substance information (Hydrogen Peroxide (35% in Water), CAS Registry Number 7722-84-1, CAS Name Hydrogen peroxide), and catalog details (Chemical Name, Order Number, Quantity, Price, Stock Status, Ships Within, Pricing Information, Last Updated, Order From Supplier). A callout box labeled 'Contact information' points to the contact details, and another labeled 'Catalog details' points to the product information. The chemical structure of Hydrogen Peroxide (HO-OH) is displayed on the right. An 'Order link' callout points to the 'Order From Supplier' link.

ChemDoodle®

ChemDoodle structure editor is available in addition to the standard CASdraw editor. ChemDoodle is useful for tablets and mobile devices.

The screenshot shows the ChemDoodle structure editor interface. The top menu bar includes 'Center', 'Flip fragment', and 'Cut | Copy | Paste'. The main toolbar contains various drawing tools such as 'Lasso', 'Clear | Eraser', 'Labeling', 'Draw bonds', 'Draw rings', 'Add charges', 'Chain tool', 'Repeating groups', 'Variable point of attachment', 'Lock atoms/chains/rings', 'Make reaction', 'Reaction mapping', and 'Break/form bonds'. Other tools include 'Undo | Redo', 'Zoom', 'Templates', and 'Open | Save'. A 'Model with CAS Registry Number' button is also present. The central workspace displays a chemical structure of a complex organic molecule. The interface is overlaid on a SciFinder search page, with 'OK' and 'Cancel' buttons at the bottom.
